## **COURSES TAUGHT**

### HD 2300 Cognitive Development

This course is designed to help students develop a broad understanding of the mechanisms, processes, and current issues in cognitive development and learn to do critical, in-depth analyses of developmental research. We discuss how children's thinking changes over the course of development and evaluate psychological theories and research on various aspects of cognitive development. Topics include perception, representation and concepts, reasoning and problem solving, social cognition, memory, metacognition, language and thought, and academic skills. Students also have hands-on research experiences with "real" kids.

### HD 2800 Cultural Psychology

This course focuses on cutting-edge research from the recently emerged, exciting field of cultural psychology. We introduce research that integrates cultural perspectives into psychology, and consider theoretical and methodological issues unique for studying the role of culture in psychological processes and functioning. Drawing on recent work in social psychology, developmental psychology, cognitive psychology, and cultural anthropology, we consider a variety of topics (e.g., the self, motivation, morality, emotion, cognition, psychopathology, interpersonal relationships) from cultural perspectives.

### HD 3380 Social Cognition and Development

This course is offered to students who are interested in children's thinking pertaining to themselves and their social world. It encompasses cutting-edge developmental research on social cognition in social neuropsychology, experimental social-cognitive psychology, and cultural psychology. We will examine major theories and empirical findings on a wide range of topics, including the self, theory of mind, autobiographical

memory, emotion cognition, moral reasoning, concept of learning, intergroup bias, peer perception, and so on. These social-cognitive faculties represent universal human capacity with neurological underpinnings as well as culture-specific competence that enables children to effectively navigate in their social world.

#### HD 4520 Culture and Human Development

The course takes an interdisciplinary approach to address the central role of culture in human development. It draws on diverse theoretical perspectives, including psychology, anthropology, education, ethnography, and linguistics, to understand human difference, experience, and complexity. Empirical reflections are taken upon major developmental topics such as cultural aspects of physical growth and development; culture and cognition; culture and language; culture, self, and personality; cultural construction of emotion; culture issues of sex and gender; and cultural differences in pathology.

#### HD 4310/6390 Mind, Self, and Emotion: Research Seminar

This research seminar is offered to students who are currently conducting research or planning to do research in the near future on one of the three topics – autobiographical memory, self, and emotion. We examine current data and theories concerning the topics from a variety of perspectives and at multiple levels of analysis, particularly focusing on the interconnections among these fields of inquiry. The "scale of observation" is viewed as occurring within the person (brain mechanisms, including genetics), at the level of the person (content--goals, beliefs, desires, etc.), and between persons (relationships, and group interaction--including culture).

#### HD 6310 Proseminar on Cognitive Development

This pro-seminar addresses current theory and research on various aspects of cognitive development across the lifespan, with emphasis on infancy and early childhood. Topics include perception, representation and concepts, reasoning and problem solving, social cognition, memory, metacognition, language and thought, and academic skills. Students will develop a broad understanding of the mechanisms, processes, and current issues in cognitive development as well as skills to critically assess developmental research.

#### HD 6210 Seminar on Autobiographical Memory

This graduate seminar is designed to give an overview as well as in-depth analysis of topics related to autobiographical memory and its development. Readings focus heavily on current theories and empirical research on a wide range of topics including childhood amnesia, reminiscence bump, emotion and memory, accuracy, development and disruption, neurological perspectives, memory functions, and memory across cultures.

## HD 6350 Cultural Psychology

This graduate seminar focuses on cutting-edge research from the recently emerged, exciting field of cultural psychology. We discuss major theories that integrate cultural perspectives into psychology, and consider methodological issues unique for studying the role of culture in psychological processes and functioning. Drawing on recent work in social psychology, developmental psychology, cognitive psychology, and cultural anthropology, we consider a variety of topics (e.g., the self, motivation, morality, emotion, cognition, psychopathology, interpersonal relationships) from cultural perspectives.
