Outcomes of Participants in Cornell Cooperative Extension Parent Education Programs in Tompkins County

Cornell Cooperative Extension (CCE) of Tompkins County offers a variety of programs for parents and caregivers. These programs reach a wide range of families and seek to promote positive parenting and, ultimately, healthy family and child development. This research brief presents data collected from participants in Tompkins County CCE parent education programs held from August 2010 to July 2011. Data were collected from participants at the first session (a pre-test) and at the last session (a post-test) and was gathered from those parents and caregivers

taking part in programs that comprised at least six hours of content delivery. Results of the analysis of these data are shown below.

Demographics of Participants in Programs in Tompkins County, New York

The following summaries use data from 150 participants who completed a pre-test survey given at the first session of their parent education class. A majority of participants attended the Parenting Skills Workshops Series (83%).

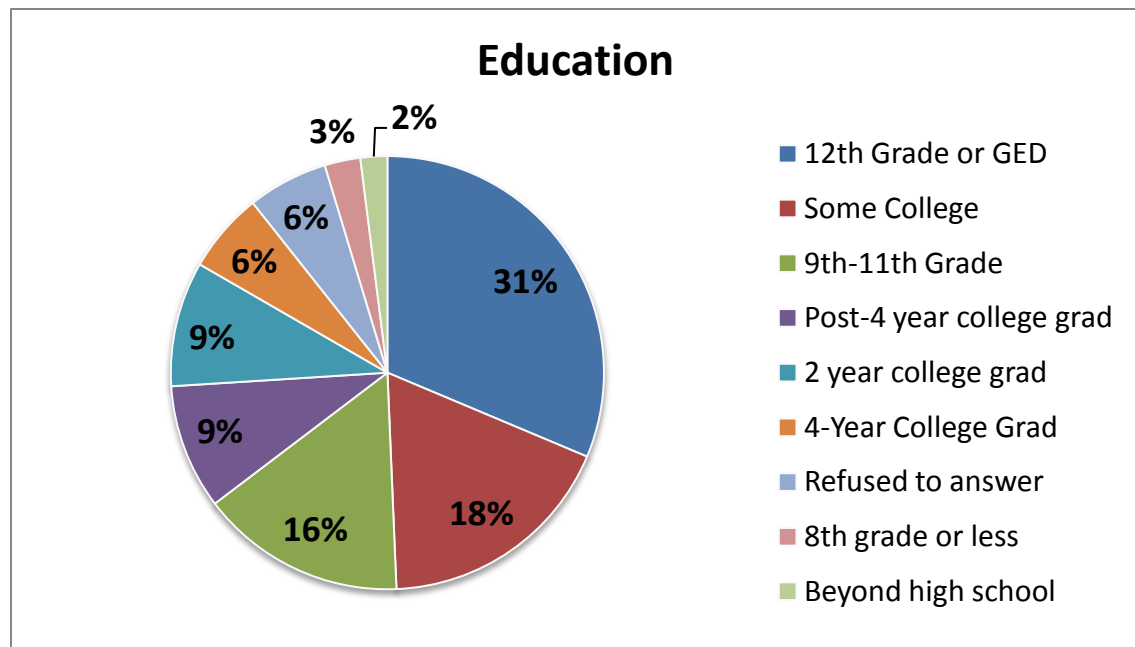

The majority (59%) of participants in the Tompkins County CCE parenting

classes were females.

Educational attainment among the participants varied widely, with the greatest number of participants education stopped at 12th grade or a

GED (31%) followed by those having attended, but not graduated from, college (18%).

The vast majority of the participants in Tompkins County CCE parent education classes were white (81%),

and 47% of the participants were married or partnered.

Pre-Post Survey Results

This study used a pre- and post-test evaluation, in which the participants were asked to answer two identical surveys—one given at the first session of the class and another given after the completion of the last parenting class. The survey included ten questions about parenting attitudes, behaviors, and knowledge designed to capture some of what was taught in the class. The pre/post study design allows researchers to see if attitudes, behaviors, and knowledge change during the course of the workshop. Using this type of research design does not allow one to determine whether taking part in the parent education class *caused* a change in knowledge, attitude or behaviors; such changes could occur for other reasons outside of the workshop. However, it is possible that any significant pre-to-post changes in parenting attitudes, behaviors and knowledge that are observed may have resulted from taking part in the program.

The following evaluation is based on information provided by 82 participants, who completed a parent education program and completed both a pre- and a post-test survey. Two of the ten items on the survey showed significant improvements from the pre- to the post-test. Specifically, participants of parent education classes at CCE of Tompkins County reported increased patience with their child and increased confidence in making rules which take their child's needs into consideration.

A p-value generated from a paired t-test was used as a statistical measure to determine whether a change in a given survey question between the pre- and post-test was significant. A p-value of .10 or less was considered statistically significant, and means that we can be 90% sure that the pre-to-post changes in participant responses are not due to chance.

In comparing participants' pre- and post-test survey results, the following questions showed statistically significant changes.

These results indicate that two out of ten measures of parenting attitudes, behaviors and knowledge improved significantly from the pre- to the post-

test, highlighting an area in which CCE Tompkins County parent education programs have positive impacts on their participants.
